

Lecture 4

Single View Metrology

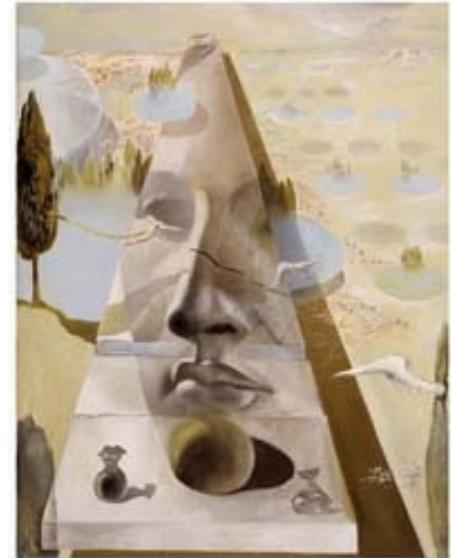

1891

Professor Silvio Savarese
Computational Vision and Geometry Lab

Lecture 4

Single View Metrology

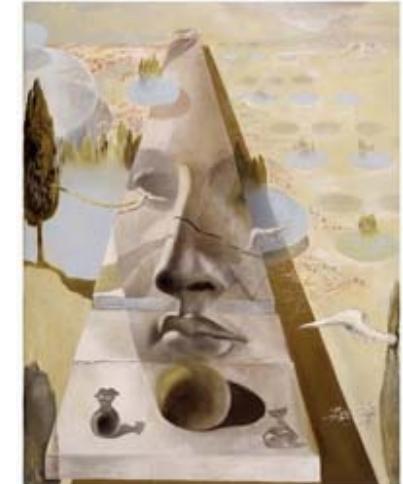

Announcements:

- Remember to review the basics of linear algebra – e.g. SVD, etc...!!
- Read notes of lecture 2!

Lecture 4

Single View Metrology

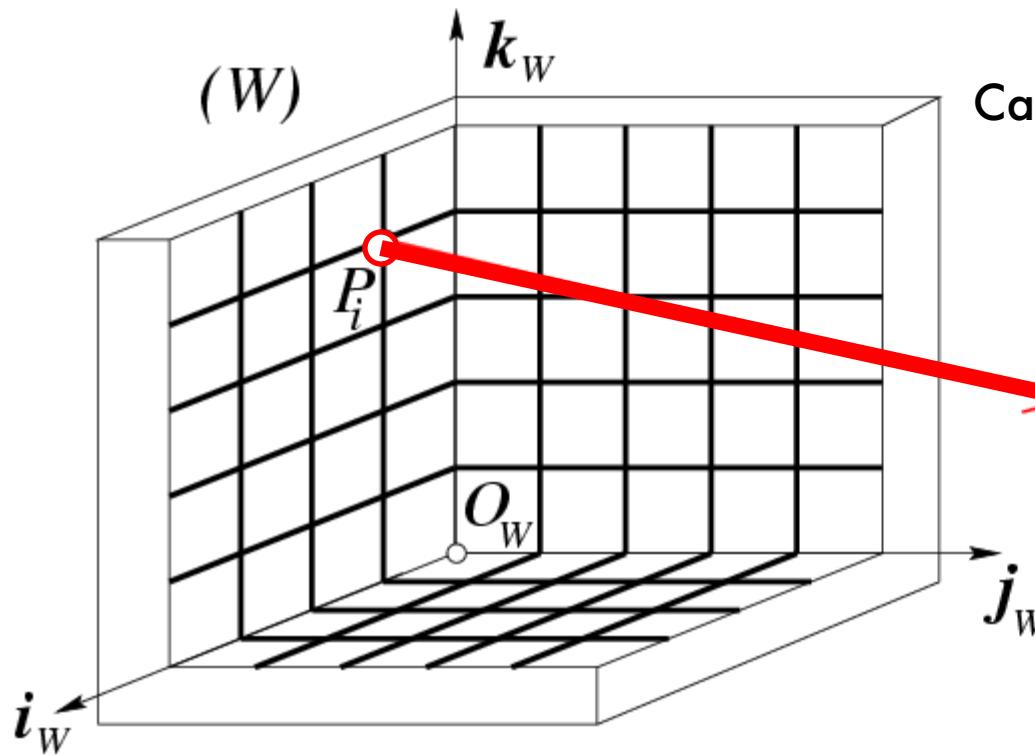

- Review calibration and 2D transformations
- Vanishing points and lines
- Estimating geometry from a single image
- Extensions

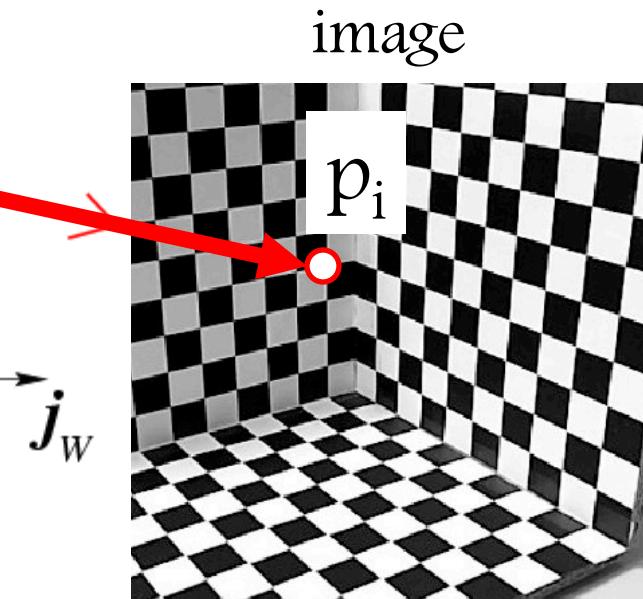

Reading:

- [HZ] Chapter 2 “Projective Geometry and Transformation in 2D”
- [HZ] Chapter 3 “Projective Geometry and Transformation in 3D”
- [HZ] Chapter 8 “More Single View Geometry”
- [Hoeim & Savarese] Chapter 2

Calibration Problem

Calibration rig

$$p_i = \begin{bmatrix} u_i \\ v_i \end{bmatrix} = M P_i$$

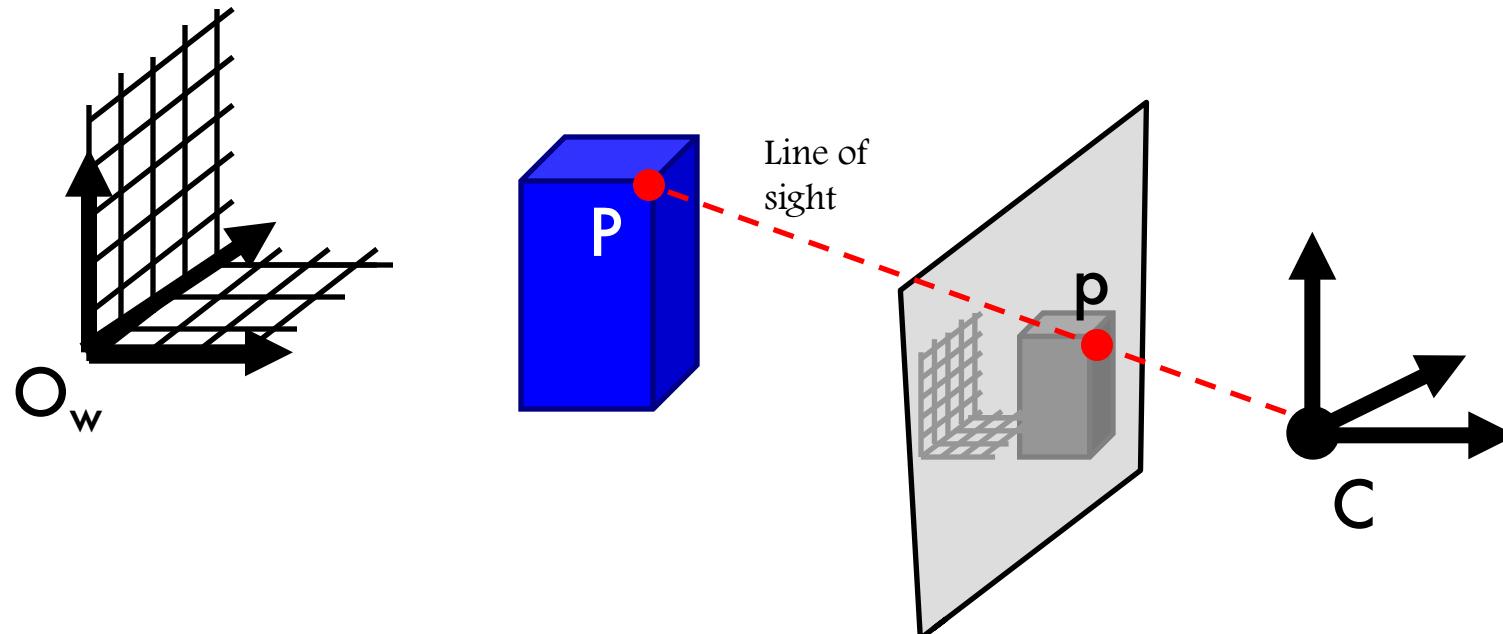

In pixels

World ref. system

$$M = K[R \ T]$$

11 unknowns
Need at least 6 correspondences

Once the camera is calibrated...

$$M = K[R \ T]$$

- Internal parameters K are known
- R, T are known – but these can only relate C to the calibration rig

Can I estimate P from the measurement p from a single image?

No - in general 😞 (P can be anywhere along the line defined by C and p)

Recovering structure from a single view

<http://www.robots.ox.ac.uk/~vgg/projects/SingleView/models/hut/hutme.wrl>

Transformation in 2D

-Isometries

-Similarities

-Affinity

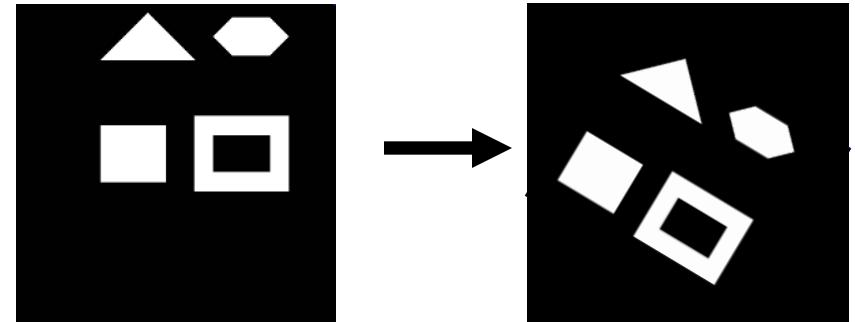

-Projective

Transformation in 2D

Isometries:
[Euclideans]

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} R & t \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = H_e \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} \quad [\text{Eq. 4}]$$

- Preserve distance (areas)
- 3 DOF
- Regulate motion
of rigid object

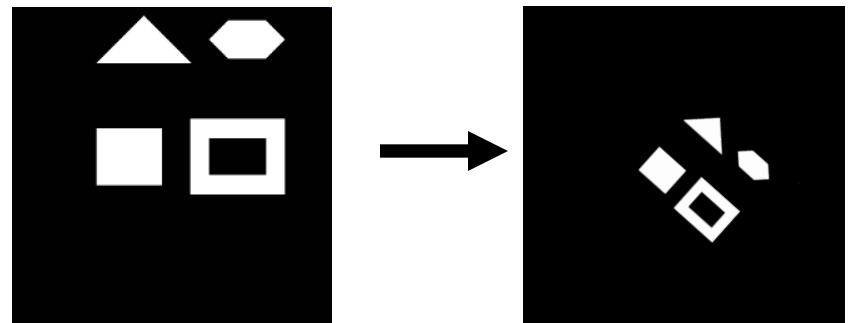

Transformation in 2D

Similarities:

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} S & R & t \\ 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = H_s \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$
$$S = \begin{bmatrix} s & 0 \\ 0 & s \end{bmatrix} \quad [\text{Eq. 5}]$$

- Preserve
 - ratio of lengths
 - angles
- 4 DOF

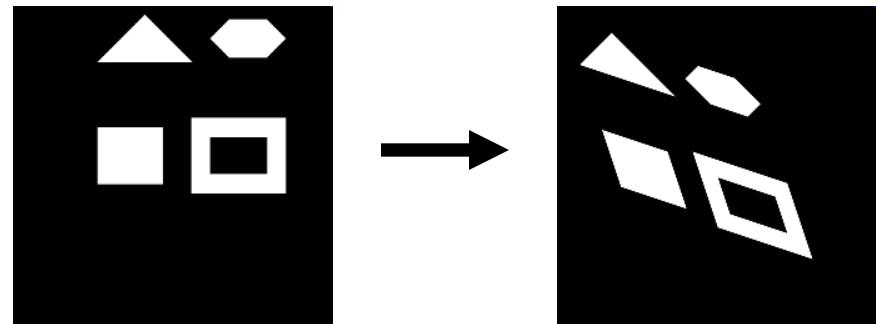

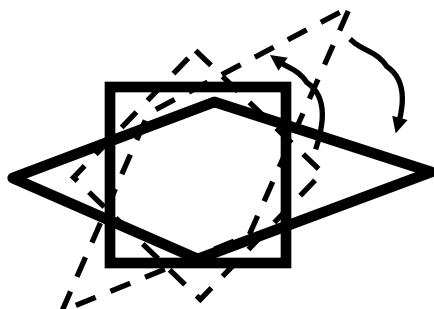

Transformation in 2D

Affinities:

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} A & t \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = H_a \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} \quad [\text{Eq. 6}]$$

$$A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} = R(\theta) \cdot R(-\phi) \cdot D \cdot R(\phi) \quad D = \begin{bmatrix} s_x & 0 \\ 0 & s_y \end{bmatrix}$$

[Eq. 7]

Transformation in 2D

Affinities:

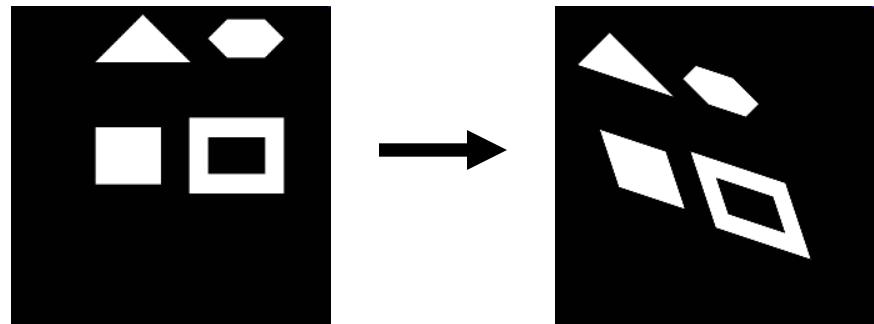

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} A & t \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = H_a \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} \quad [\text{Eq. 6}]$$

$$A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} = R(\theta) \cdot R(-\phi) \cdot D \cdot R(\phi) \quad D = \begin{bmatrix} s_x & 0 \\ 0 & s_y \end{bmatrix}$$

[Eq. 7]

-Preserve:

- Parallel lines
 - Ratio of areas
 - Ratio of lengths on collinear lines
 - others...
- 6 DOF

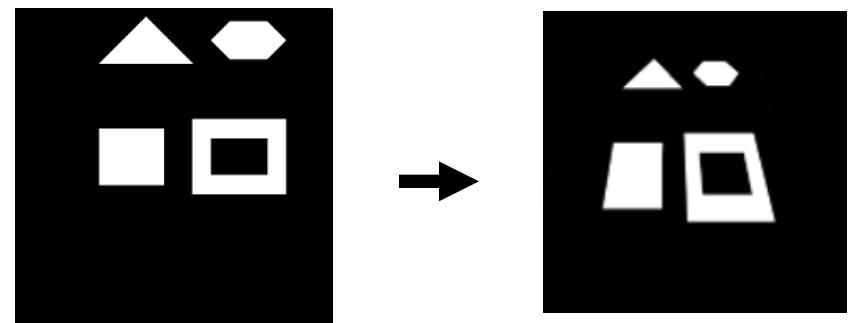

Transformation in 2D

Projective:

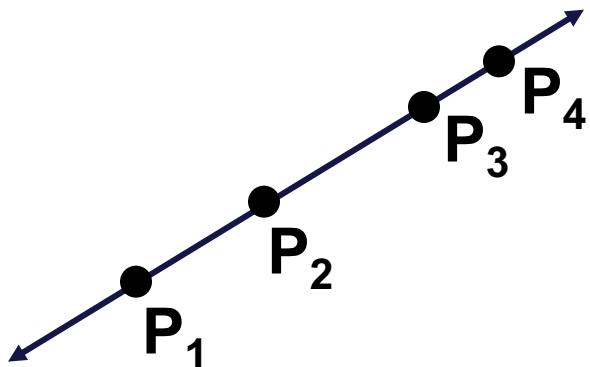

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} A & t \\ v \\ b \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = H_p \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} \quad [\text{Eq. 8}]$$

- 8 DOF
- Preserve:
 - collinearity
 - cross ratio of 4 collinear points
 - and a few others...

The cross ratio

The cross-ratio of 4 collinear points is defined as

[Eq. 9]

$$\frac{\|\mathbf{P}_3 - \mathbf{P}_1\| \|\mathbf{P}_4 - \mathbf{P}_2\|}{\|\mathbf{P}_3 - \mathbf{P}_2\| \|\mathbf{P}_4 - \mathbf{P}_1\|}$$

$$\mathbf{P}_i = \begin{bmatrix} X_i \\ Y_i \\ Z_i \\ 1 \end{bmatrix}$$

Lecture 4

Single View Metrology

- Review calibration and 2D transformations

- Extensions

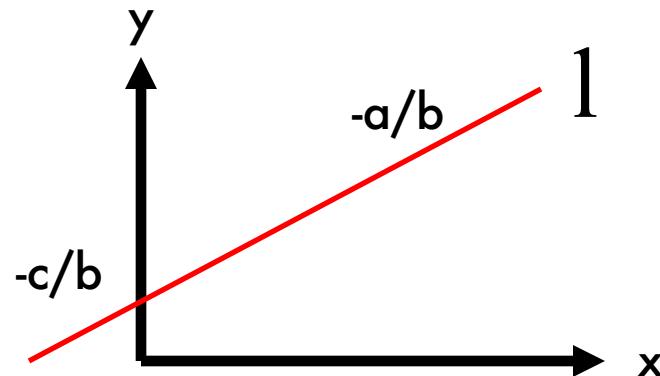

Reading:

- [HZ] Chapter 2 “Projective Geometry and Transformation in 2D”
- [HZ] Chapter 3 “Projective Geometry and Transformation in 3D”
- [HZ] Chapter 8 “More Single View Geometry”
- [Hoeim & Savarese] Chapter 2

Lines in a 2D plane

$$ax + by + c = 0$$

$$1 = \begin{bmatrix} a \\ b \\ c \end{bmatrix}$$

If $x = [x_1, x_2]^T \in l$

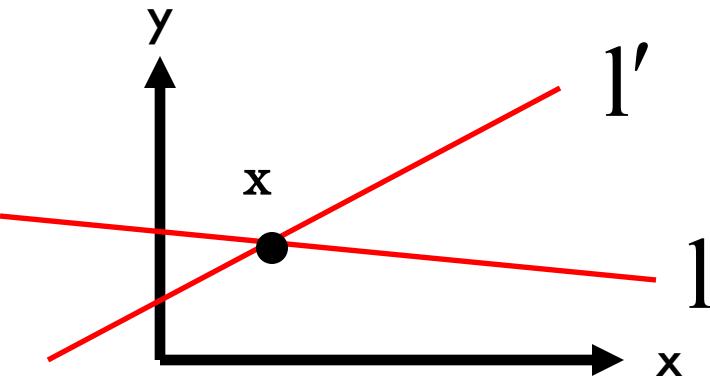

$$\begin{bmatrix} x_1 \\ x_2 \\ 1 \end{bmatrix}^T \begin{bmatrix} a \\ b \\ c \end{bmatrix} = 0$$

[Eq. 10]

Lines in a 2D plane

Intersecting lines

$$x = l \times l' \quad [\text{Eq. 11}]$$

Proof

$$l \times l' \perp l \rightarrow (l \times l') \cdot l = 0 \rightarrow x \in l \quad [\text{Eq. 12}]$$

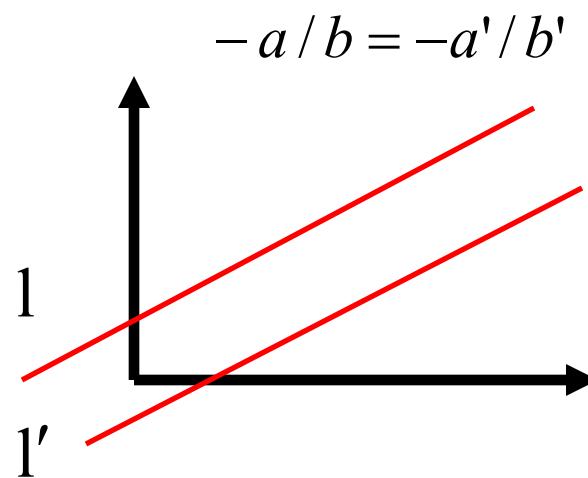

$$l \times l' \perp l' \rightarrow \underbrace{(l \times l')}_{x} \cdot l' = 0 \rightarrow x \in l' \quad [\text{Eq. 13}]$$

→ x is the intersection point

2D Points at infinity (ideal points)

$$x = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}, x_3 \neq 0$$

$$x_\infty = \begin{bmatrix} x'_1 \\ x'_2 \\ 0 \end{bmatrix}$$

$$l = \begin{bmatrix} a \\ b \\ c \end{bmatrix}$$

$$l' = \begin{bmatrix} a' \\ b' \\ c' \end{bmatrix}$$

Let's intersect two parallel lines:

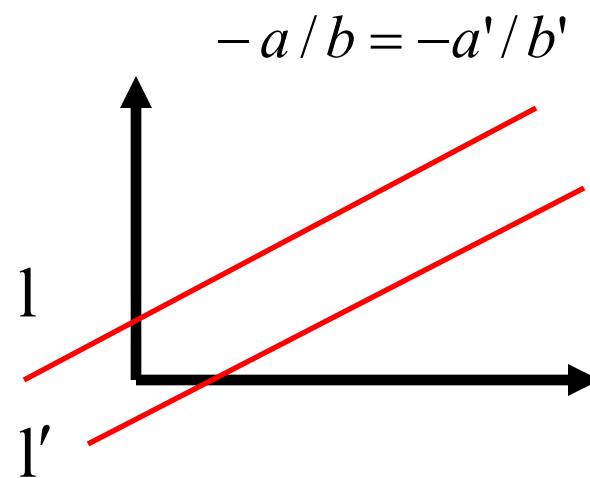

$$\rightarrow l \times l' \propto \begin{bmatrix} b \\ -a \\ 0 \end{bmatrix} = x_\infty \quad [\text{Eq.13}]$$

= **ideal point!**

- In Euclidian coordinates this point is at infinity
- Agree with the general idea of two lines intersecting at infinity

2D Points at infinity (ideal points)

$$x = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}, x_3 \neq 0$$

$$l = \begin{bmatrix} a \\ b \\ c \end{bmatrix}$$

$$l' = \begin{bmatrix} a' \\ b' \\ c' \end{bmatrix}$$

Note: the line $l = [a \ b \ c]^T$ pass through the ideal point x_∞

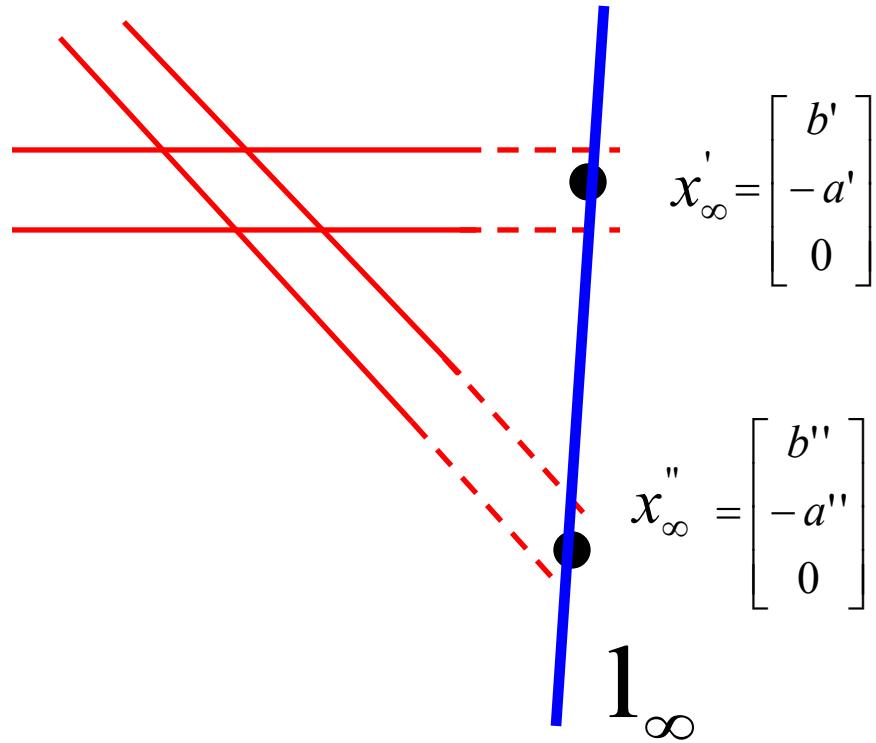

$$l^T x_\infty = \begin{bmatrix} a & b & c \end{bmatrix} \begin{bmatrix} b \\ -a \\ 0 \end{bmatrix} = 0 \quad [\text{Eq. 15}]$$

So does the line l' since $a'b' = a'b$

Lines infinity l_∞

Set of ideal points lies on a line called the line at infinity.
How does it look like?

$$l_\infty = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$$

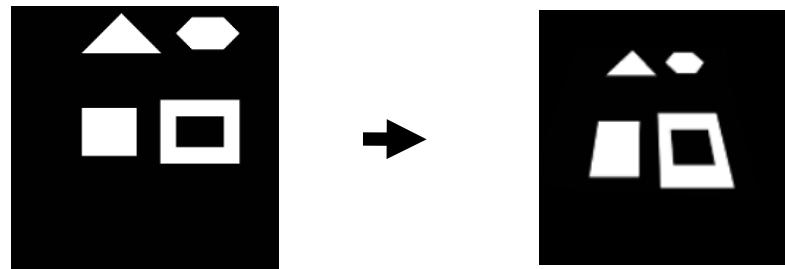

Indeed:

$$\begin{bmatrix} x_1 \\ x_2 \\ 0 \end{bmatrix}^T \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} = 0$$

A line at infinity can be thought of the set of "directions" of lines in the plane

Projective transformation of a point at infinity

$$H = \begin{bmatrix} A & t \\ v & b \end{bmatrix}$$

$$p' = H \ p$$

is it a point at infinity?

$$H \ p_\infty = ? = \begin{bmatrix} A & t \\ v & b \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} = \begin{bmatrix} p'_x \\ p'_y \\ p'_z \end{bmatrix}$$

...no!

[Eq. 17]

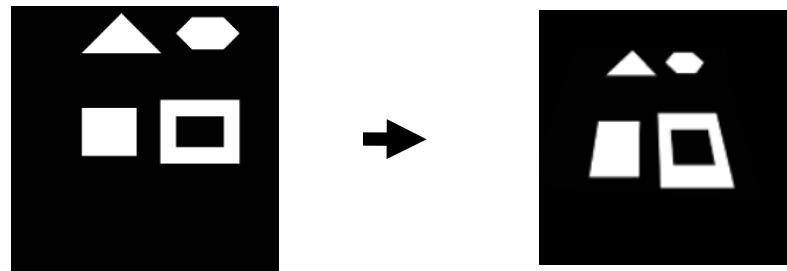

$$H_A \ p_\infty = ? = \begin{bmatrix} A & t \\ 0 & b \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} = \begin{bmatrix} p'_x \\ p'_y \\ 0 \end{bmatrix}$$

An affine transformation of a point at infinity is still a point at infinity

[Eq. 18]

Projective transformation of a line (in 2D)

$$H = \begin{bmatrix} A & t \\ v & b \end{bmatrix}$$

$$l' = H^{-T} l$$

[Eq. 19]

is it a line at infinity?

$$H^{-T} l_\infty = ? = \begin{bmatrix} A & t \\ v & b \end{bmatrix}^{-T} \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} = \begin{bmatrix} t_x \\ t_y \\ b \end{bmatrix}$$

...no!

[Eq. 20]

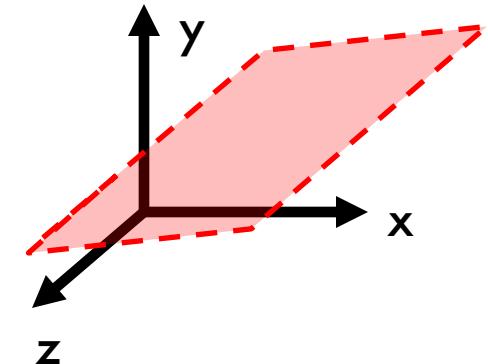

$$H_A^{-T} l_\infty = ? = \begin{bmatrix} A & t \\ 0 & 1 \end{bmatrix}^{-T} \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} = \begin{bmatrix} A^{-T} & 0 \\ -t^T A^{-T} & 1 \end{bmatrix} \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$$

[Eq. 21]

Points and planes in 3D

$$x = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ 1 \end{bmatrix}$$

$$\Pi = \begin{bmatrix} a \\ b \\ c \\ d \end{bmatrix}$$

$$x \in \Pi \Leftrightarrow x^T \Pi = 0$$

[Eq. 22]

$$ax + by + cz + d = 0$$

[Eq. 23]

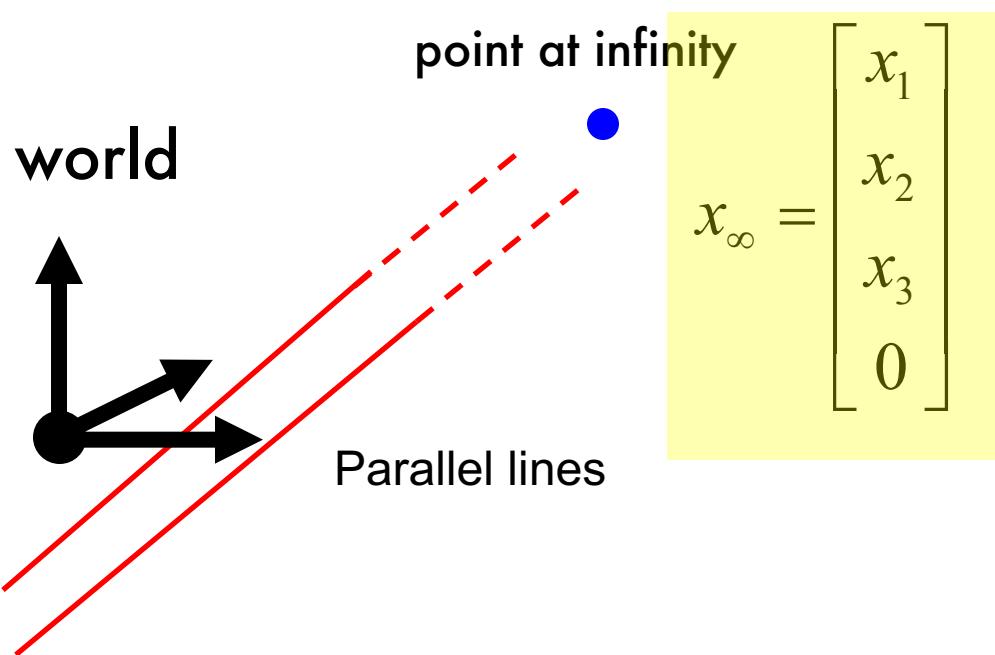

Lines in 3D

- Lines have 4 degrees of freedom - hard to represent in 3D-space
- Can be defined as intersection of 2 planes

$$\begin{aligned}\mathbf{d} &= \text{direction of the line} \\ &= [a, b, c]^T\end{aligned}$$

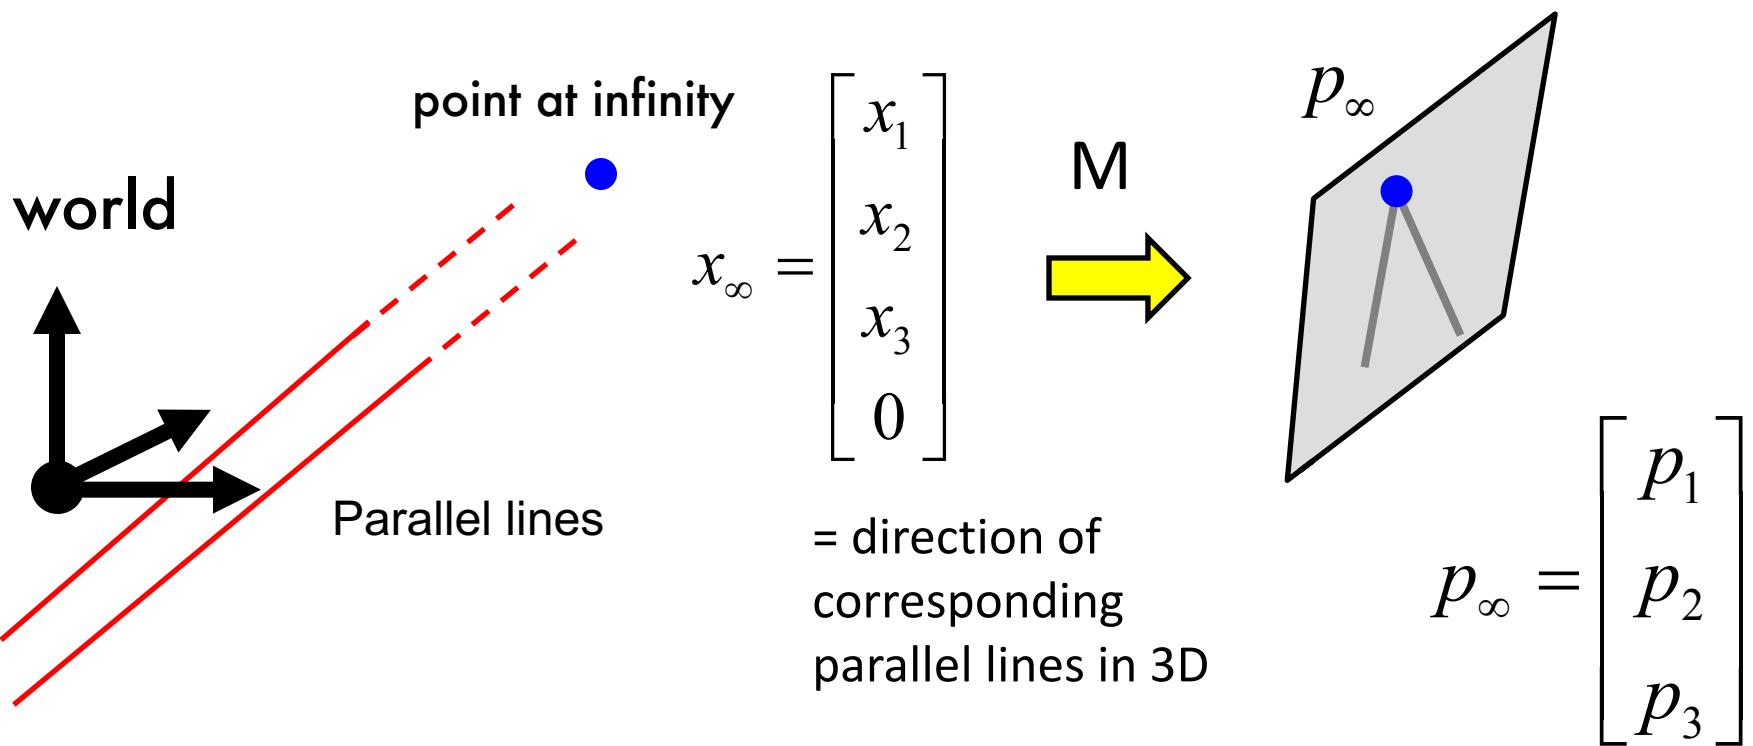

Points at infinity in 3D

Points where parallel lines intersect in 3D

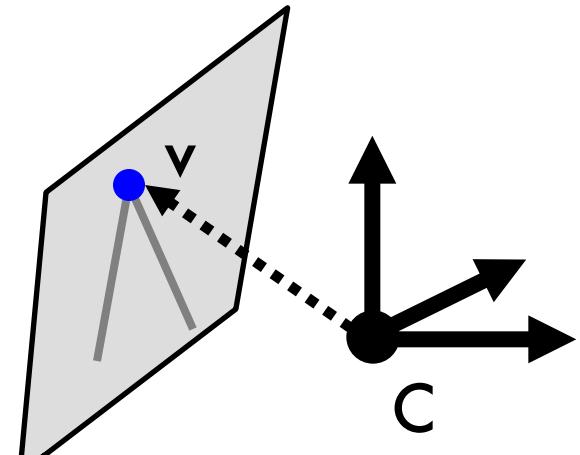

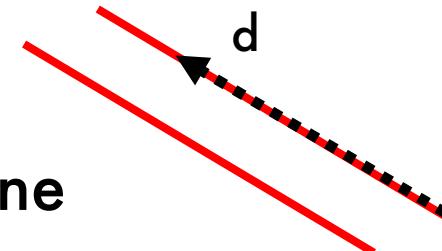

Vanishing points

The projective projection of a point at infinity into the image plane defines a vanishing point.

Vanishing points and directions

d = direction of the line
= $[a, b, c]^T$

$$\mathbf{v} = K \mathbf{d}$$

[Eq. 24]

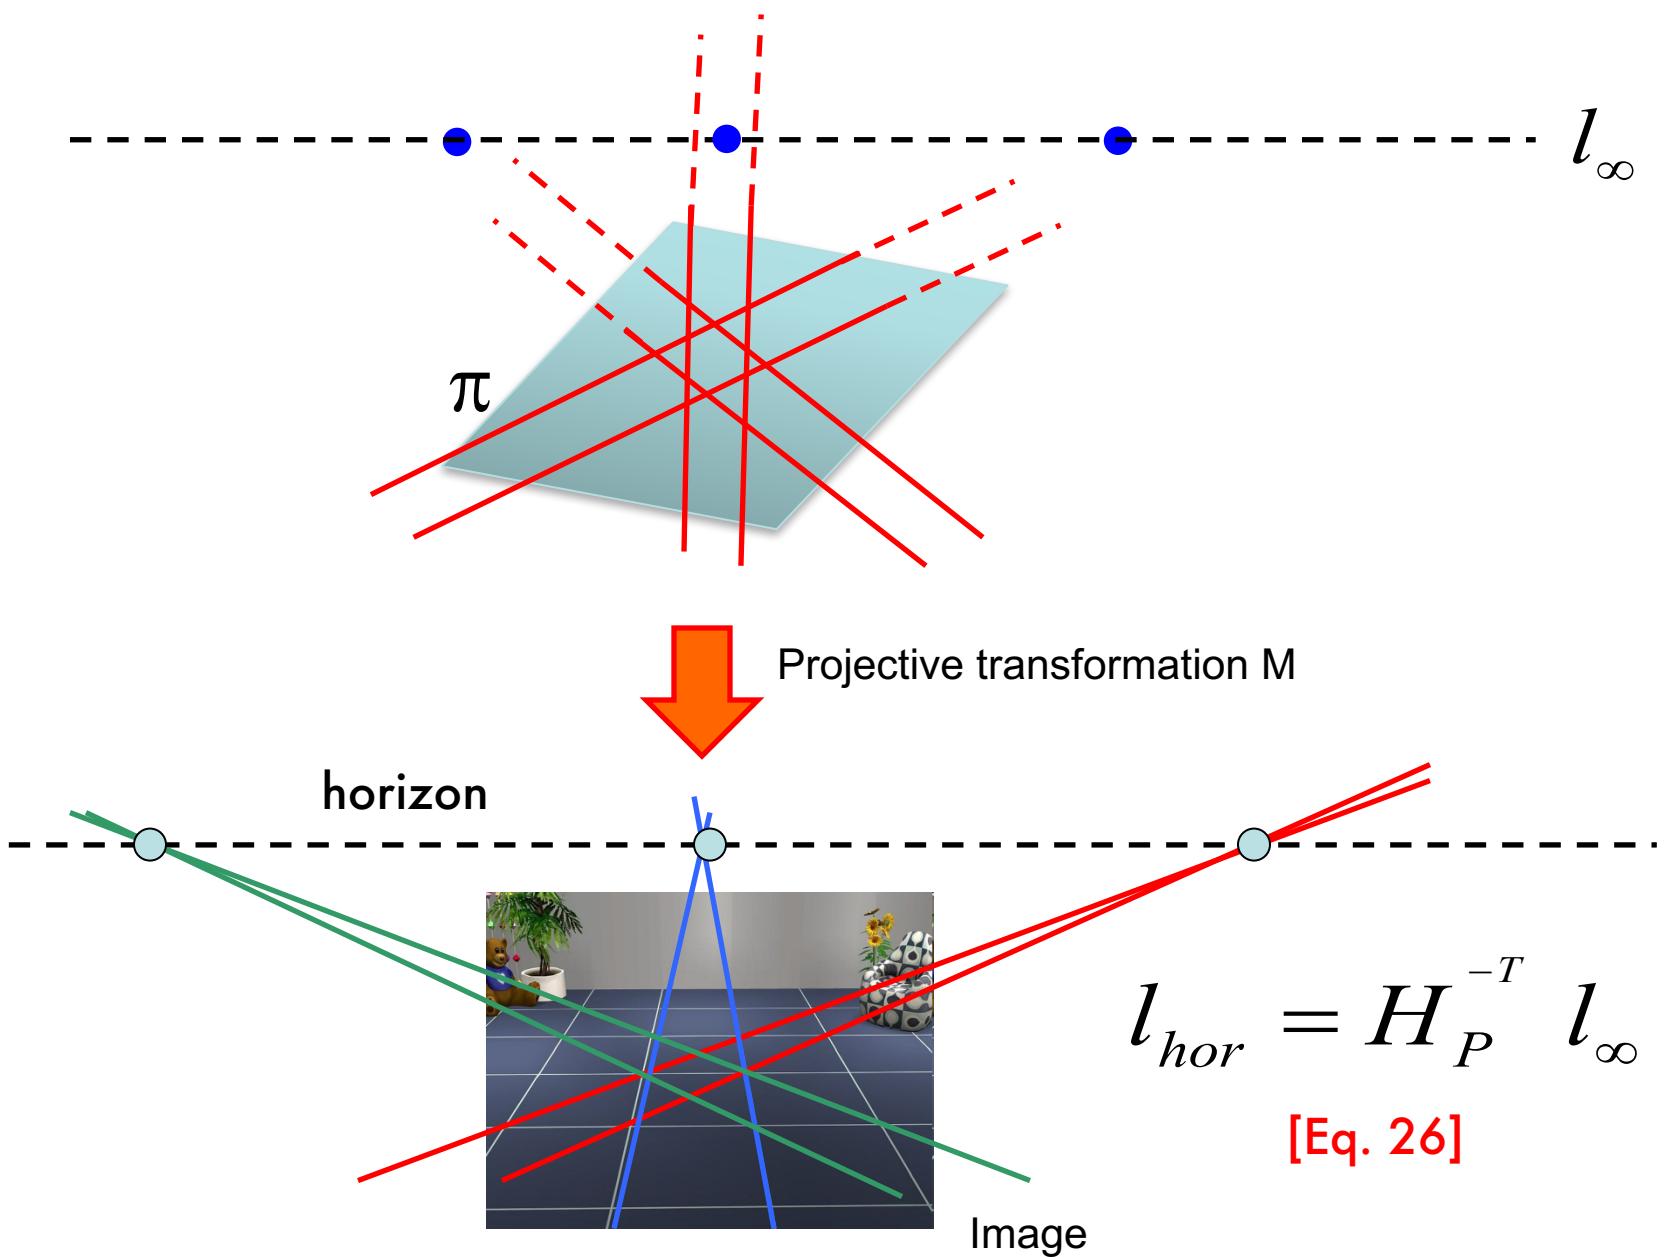

$$\mathbf{d} = \frac{K^{-1} \mathbf{v}}{\|K^{-1} \mathbf{v}\|}$$

[Eq. 25]

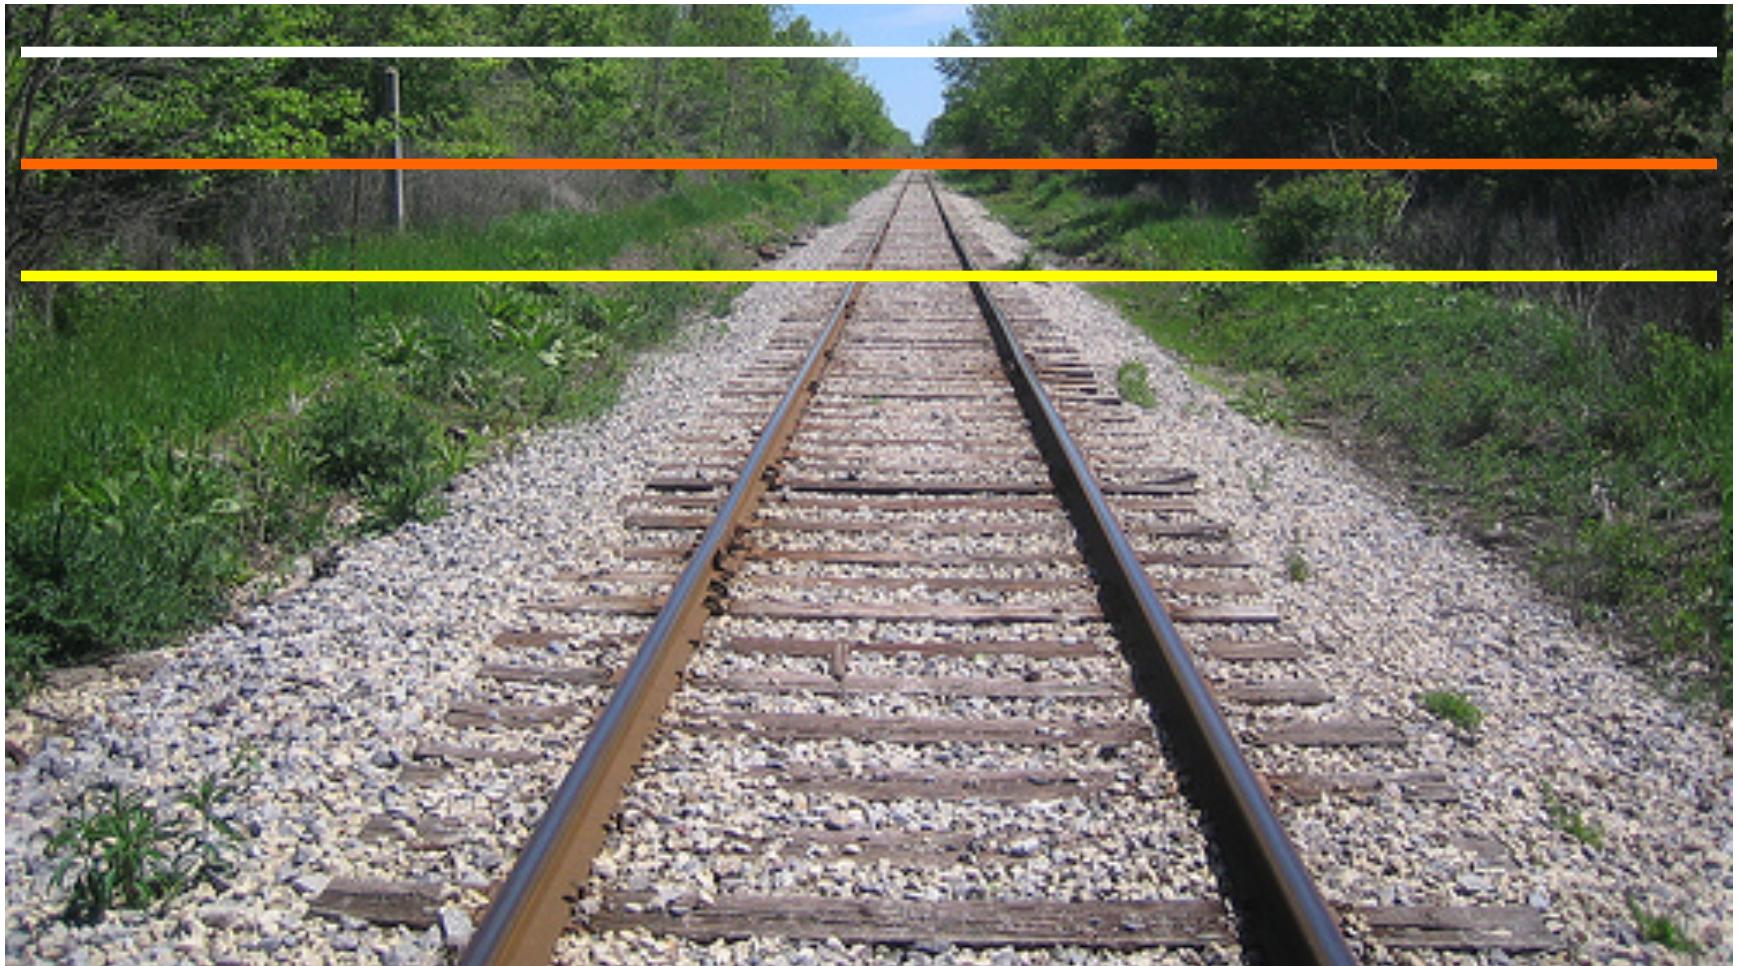

Proof:

$$X_\infty = \begin{bmatrix} a \\ b \\ c \\ 0 \end{bmatrix} \xrightarrow{M} \mathbf{v} = M X_\infty = K \begin{bmatrix} I & 0 \end{bmatrix} \begin{bmatrix} a \\ b \\ c \\ 0 \end{bmatrix} = K \begin{bmatrix} a \\ b \\ c \\ 0 \end{bmatrix} = K \begin{bmatrix} a \\ b \\ c \\ 0 \end{bmatrix}$$

Vanishing (horizon) line

Example of horizon line

The orange line is the horizon!

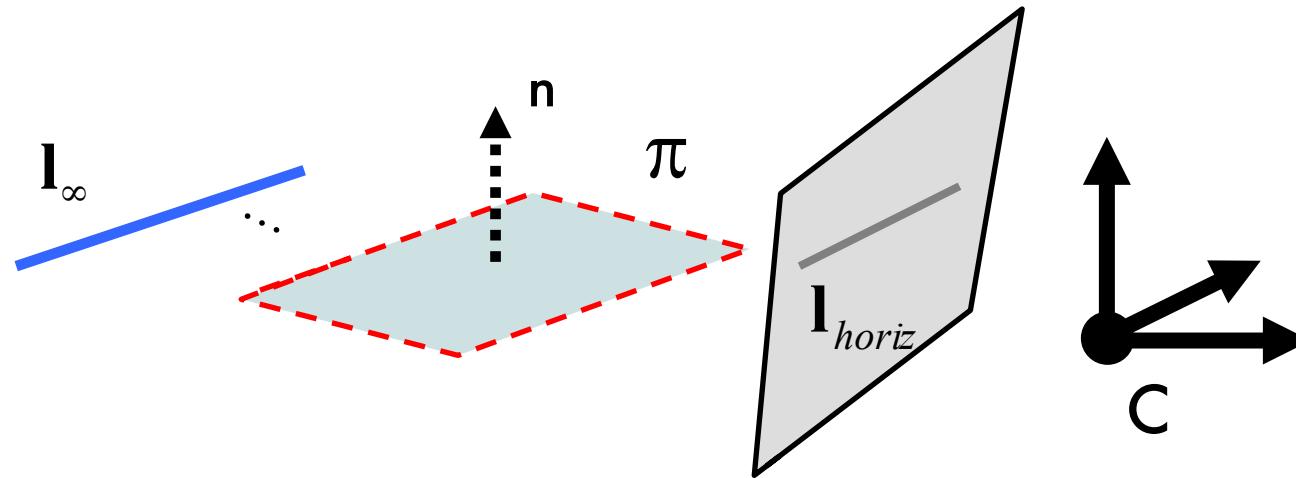

Are these two lines parallel or not?

- Recognition helps reconstruction!
- Humans have learnt this

- Recognize the horizon line
- Measure if the 2 lines meet at the horizon
- if yes, these 2 lines are // in 3D

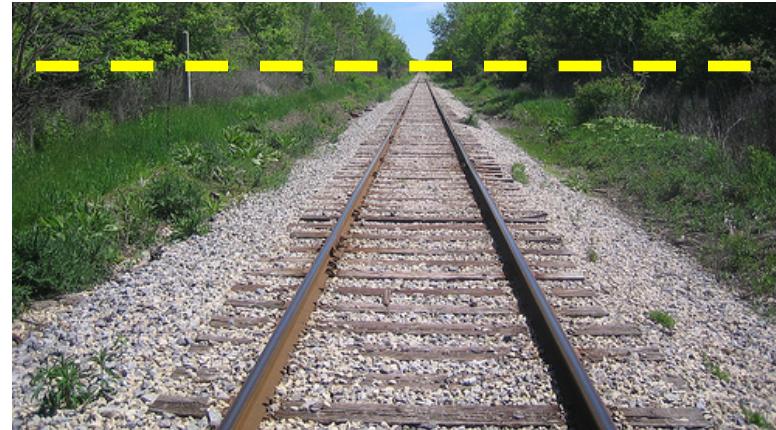

Vanishing points and planes

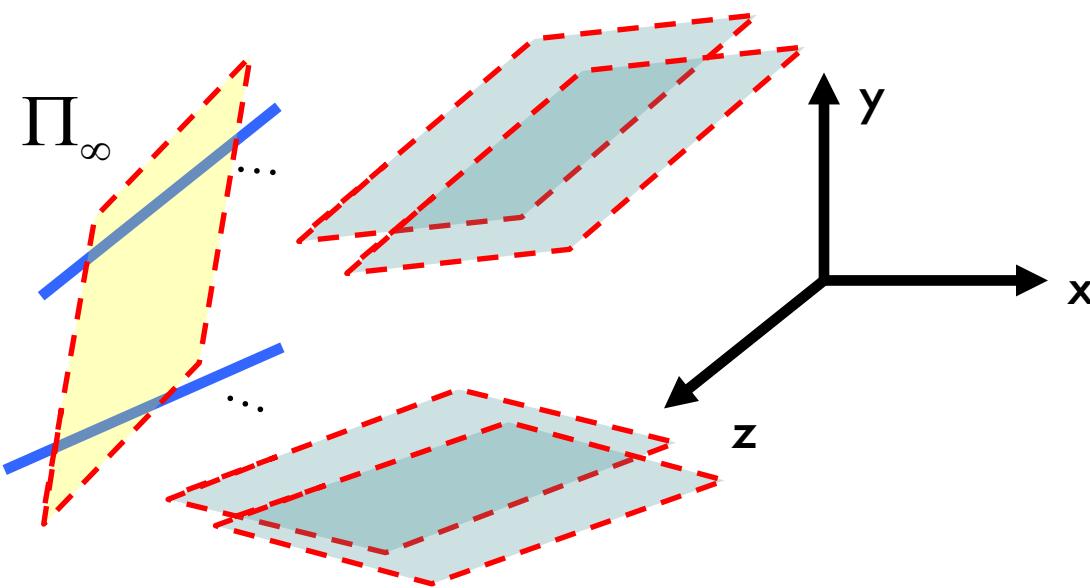

$$\mathbf{n} = \mathbf{K}^T \mathbf{l}_{horiz}$$

[Eq. 27]

See sec. 8.6.2 [HZ] for details

Planes at infinity

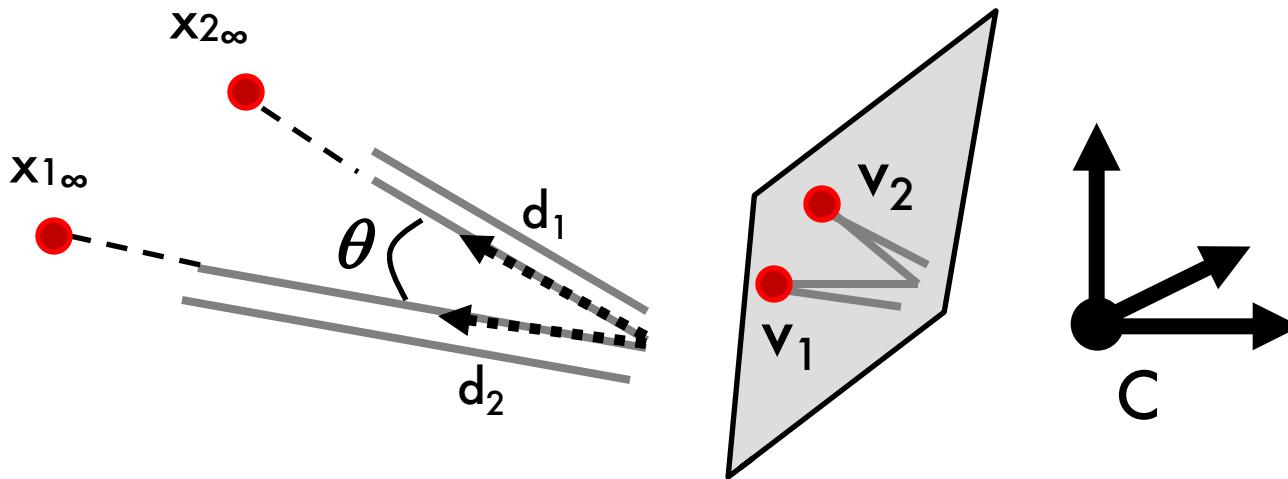

$$\Pi_{\infty} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 1 \end{bmatrix}$$

plane at infinity

- Parallel planes intersect at infinity in a common line – **the line at infinity**
- A set of 2 or more lines at infinity defines the plane at infinity Π_{∞}

Angle between 2 vanishing points

$$\cos \theta = \frac{\mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_2}{\sqrt{\mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_1} \sqrt{\mathbf{v}_2^T \boldsymbol{\omega} \mathbf{v}_2}}$$

[Eq. 28]

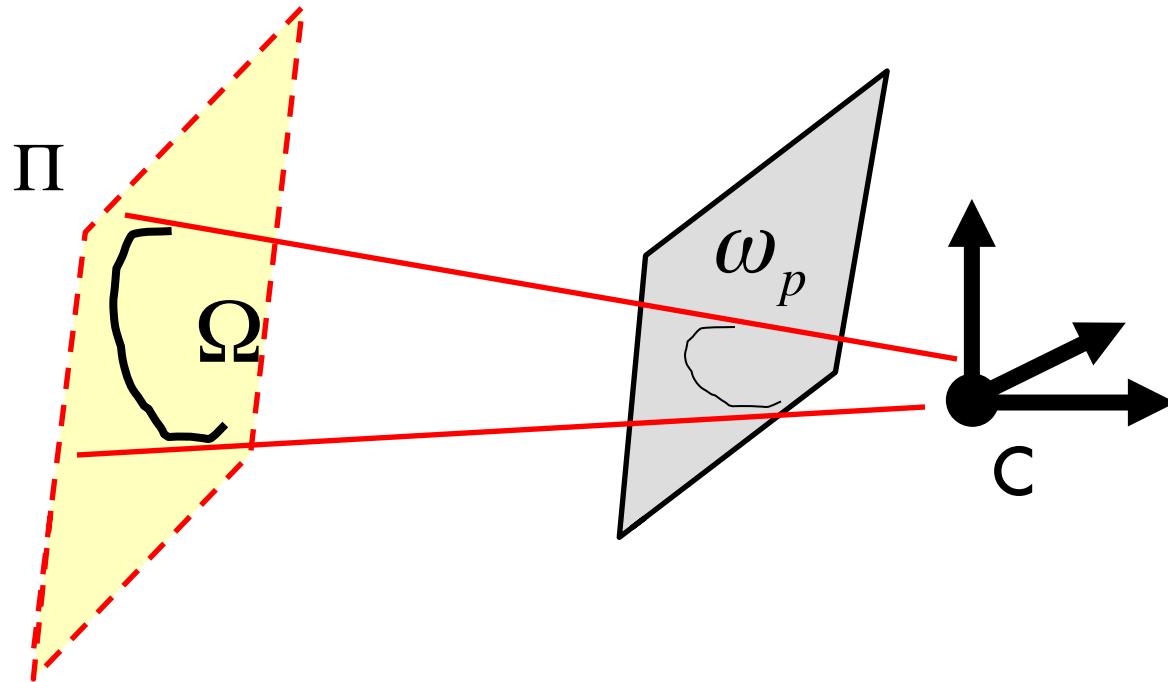

$$\boldsymbol{\omega} = (K K^T)^{-1}$$

[Eq. 30]

If $\theta = 90^\circ \rightarrow \boxed{\mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_2 = 0}$ [Eq. 29]

Scalar equation

Projective transformation of a conic Ω

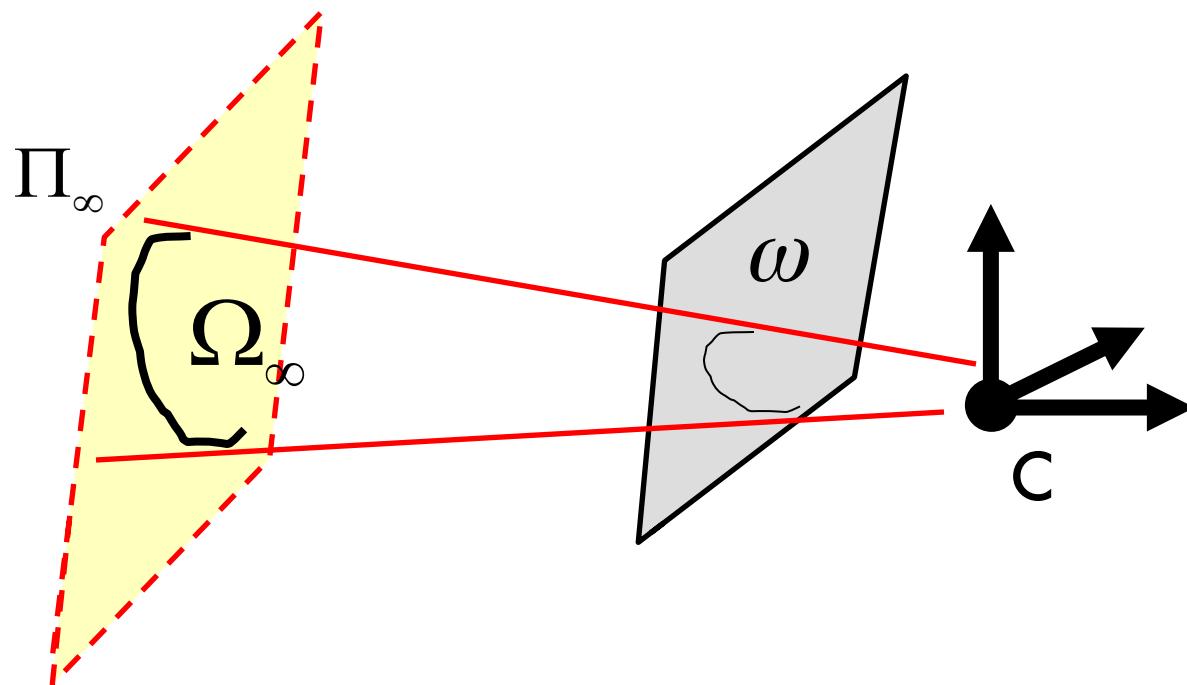

$$\omega_p = M^{-T} \Omega M^{-1}$$

HZ page 73, eq. 3.16

Projective transformation of Ω_∞

Absolute conic

$$\boldsymbol{\omega} = \boldsymbol{M}^{-T} \boldsymbol{\Omega}_\infty \boldsymbol{M}^{-1} = (\boldsymbol{K} \ \boldsymbol{K}^T)^{-1}$$

Properties of ω

$$\omega = (K \ K^T)^{-1}$$

[Eq. 30]

$$M = K \begin{bmatrix} R & T \end{bmatrix}$$

1. $\omega = \begin{bmatrix} \omega_1 & \omega_2 & \omega_4 \\ \omega_2 & \omega_3 & \omega_5 \\ \omega_4 & \omega_5 & \omega_6 \end{bmatrix}$ symmetric and known up scale
2. $\omega_2 = 0$ zero-skew
3. $\omega_2 = 0$ $\omega_1 = \omega_3$ square pixel

Summary

$$\mathbf{v} = K \mathbf{d}$$

[Eq. 24]

$$\mathbf{n} = \mathbf{K}^T \mathbf{l}_{\text{horiz}}$$

[Eq. 27]

$$\cos \theta = \frac{\mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_2}{\sqrt{\mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_1} \sqrt{\mathbf{v}_2^T \boldsymbol{\omega} \mathbf{v}_2}}$$

[Eq. 28]

$$\theta = 90^\circ$$

\rightarrow

$$\mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_2 = 0$$

[Eq. 29]

Useful to:

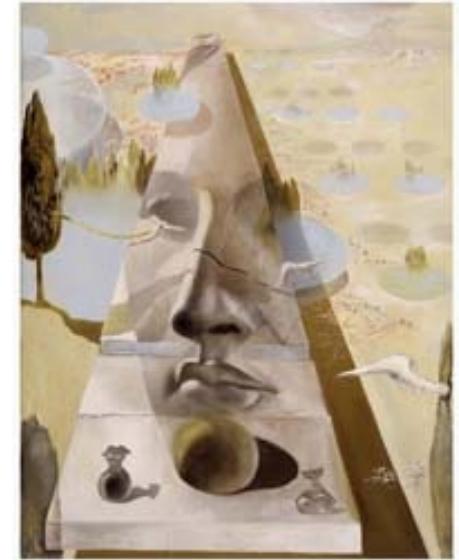

- To calibrate the camera
- To estimate the geometry of the 3D world

$$\boldsymbol{\omega} = (\mathbf{K} \mathbf{K}^T)^{-1}$$

[Eq. 30]

Lecture 4

Single View Metrology

- Review calibration
- Vanishing points and line
- Estimating geometry from a single image
- Extensions

Reading:

- [HZ] Chapter 2 “Projective Geometry and Transformation in 3D”
- [HZ] Chapter 3 “Projective Geometry and Transformation in 3D”
- [HZ] Chapter 8 “More Single View Geometry”
- [Hoeim & Savarese] Chapter 2

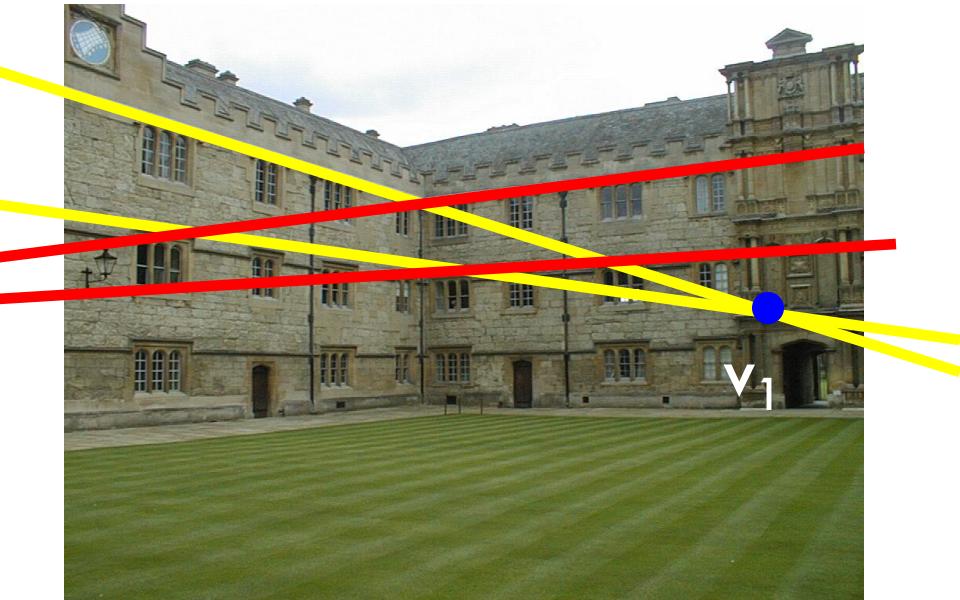

Single view calibration - example

[Eq. 28]

$$\cos \theta = \frac{\mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_2}{\sqrt{\mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_1} \sqrt{\mathbf{v}_2^T \boldsymbol{\omega} \mathbf{v}_2}}$$

\mathbf{v}_2

$$\theta = 90^\circ$$

$$\left\{ \begin{array}{l} \mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_2 = 0 \\ \boldsymbol{\omega} = (\mathbf{K} \mathbf{K}^T)^{-1} \end{array} \right.$$

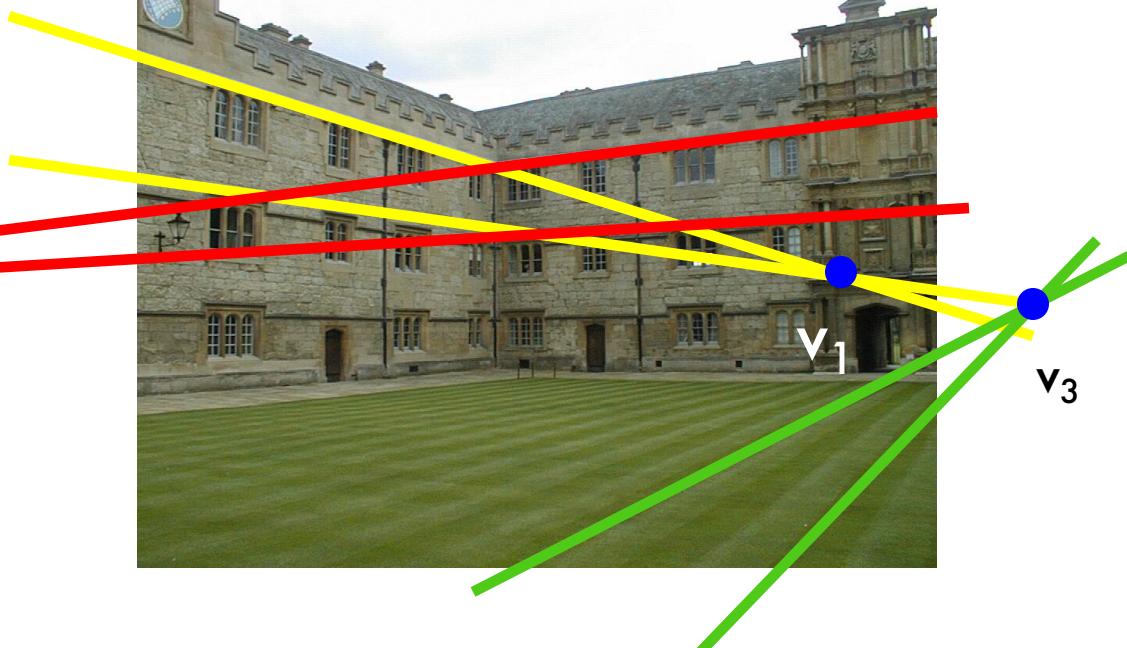

Do we have enough constraints to estimate \mathbf{K} ?
 \mathbf{K} has 5 degrees of freedom and Eq.29 is a scalar equation ☺

Single view calibration - example

[Eq. 28]

$$\cos \theta = \frac{\mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_2}{\sqrt{\mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_1} \sqrt{\mathbf{v}_2^T \boldsymbol{\omega} \mathbf{v}_2}}$$

\mathbf{v}_2

[Eq. 31]

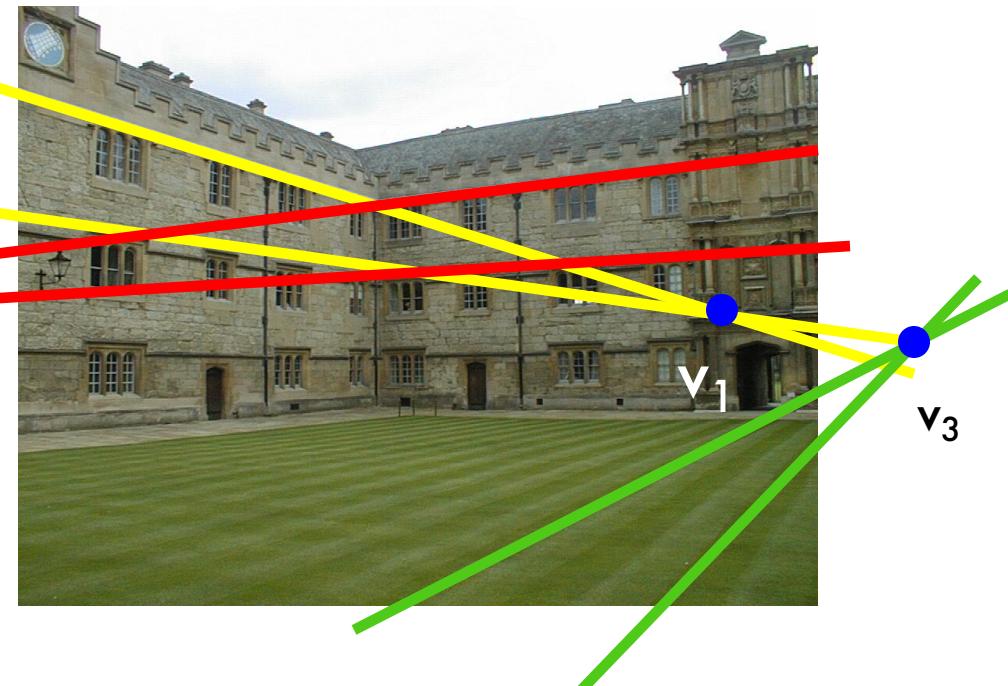

$$\left\{ \begin{array}{l} \mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_2 = 0 \\ \mathbf{v}_1^T \boldsymbol{\omega} \mathbf{v}_3 = 0 \\ \mathbf{v}_2^T \boldsymbol{\omega} \mathbf{v}_3 = 0 \end{array} \right.$$

Single view calibration - example

$$\boldsymbol{\omega} = \begin{bmatrix} \omega_1 & \omega_2 & \omega_4 \\ \omega_2 & \omega_3 & \omega_5 \\ \omega_4 & \omega_5 & \omega_6 \end{bmatrix}$$

v_2

- Square pixels
 - No skew
- $\omega_2 = 0$
 $\omega_1 = \omega_3$

[Eqs. 31]

$$\left\{ \begin{array}{l} v_1^T \boldsymbol{\omega} v_2 = 0 \\ v_1^T \boldsymbol{\omega} v_3 = 0 \\ v_2^T \boldsymbol{\omega} v_3 = 0 \end{array} \right.$$

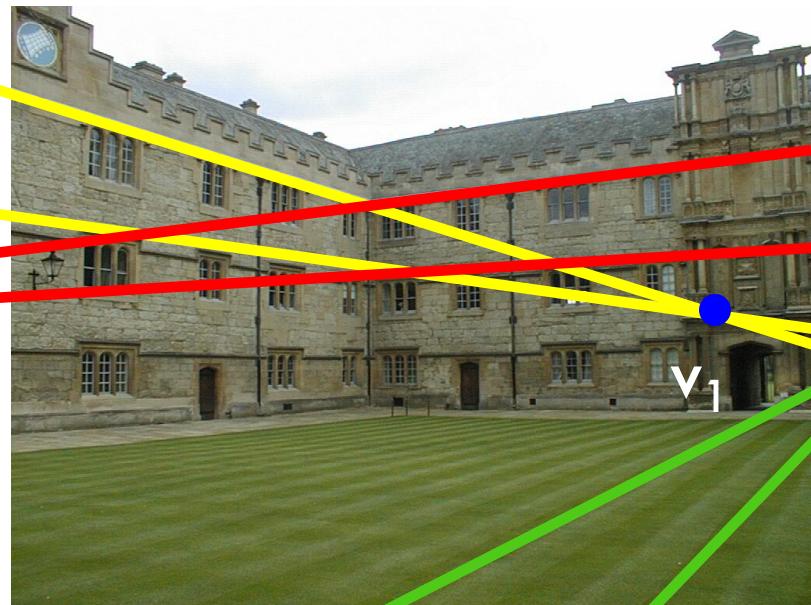

Single view calibration - example

$$\omega = \begin{bmatrix} \omega_1 & 0 & \omega_4 \\ 0 & \omega_1 & \omega_5 \\ \omega_4 & \omega_5 & \omega_6 \end{bmatrix}$$

known up to scale

v_2

- Square pixels
 - No skew
- $\omega_2 = 0$
 $\omega_1 = \omega_3$

→ Compute ω !

[Eqs. 31]

$$\left\{ \begin{array}{l} v_1^T \boldsymbol{\omega} v_2 = 0 \\ v_1^T \boldsymbol{\omega} v_3 = 0 \\ v_2^T \boldsymbol{\omega} v_3 = 0 \end{array} \right.$$

Single view calibration - example

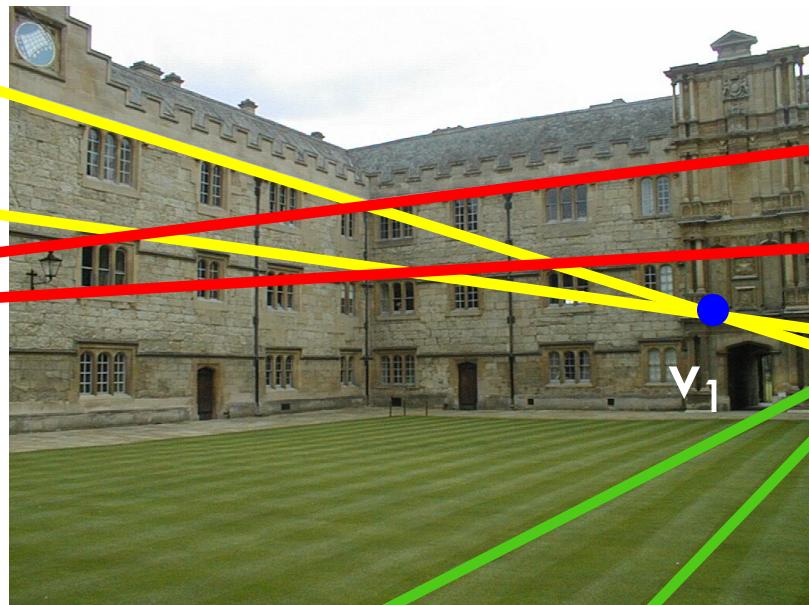

$$\omega = \begin{bmatrix} \omega_1 & 0 & \omega_4 \\ 0 & \omega_1 & \omega_5 \\ \omega_4 & \omega_5 & \omega_6 \end{bmatrix}$$

v_2

- Square pixels
 - No skew
- $\omega_2 = 0$
 $\omega_1 = \omega_3$

[Eqs. 31]

$$\left\{ \begin{array}{l} v_1^T \omega v_2 = 0 \\ v_1^T \omega v_3 = 0 \\ v_2^T \omega v_3 = 0 \end{array} \right.$$

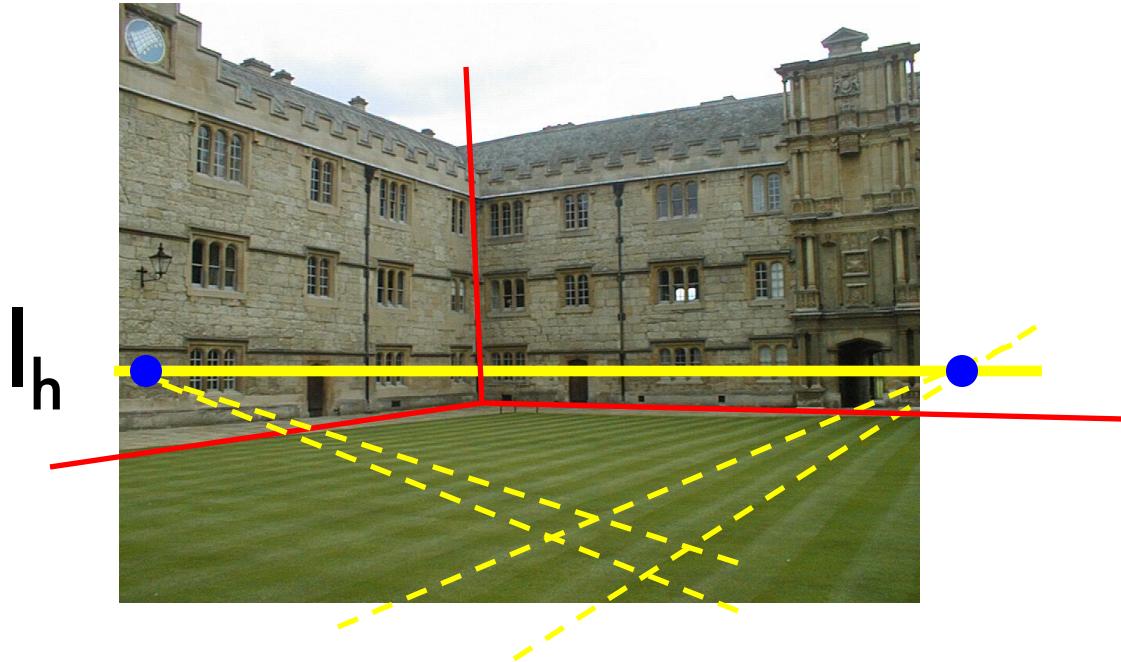

Once ω is calculated, we get K:

$$\omega = (K \ K^T)^{-1} \rightarrow K$$

(Cholesky factorization; HZ pag 582)

Single view reconstruction - example

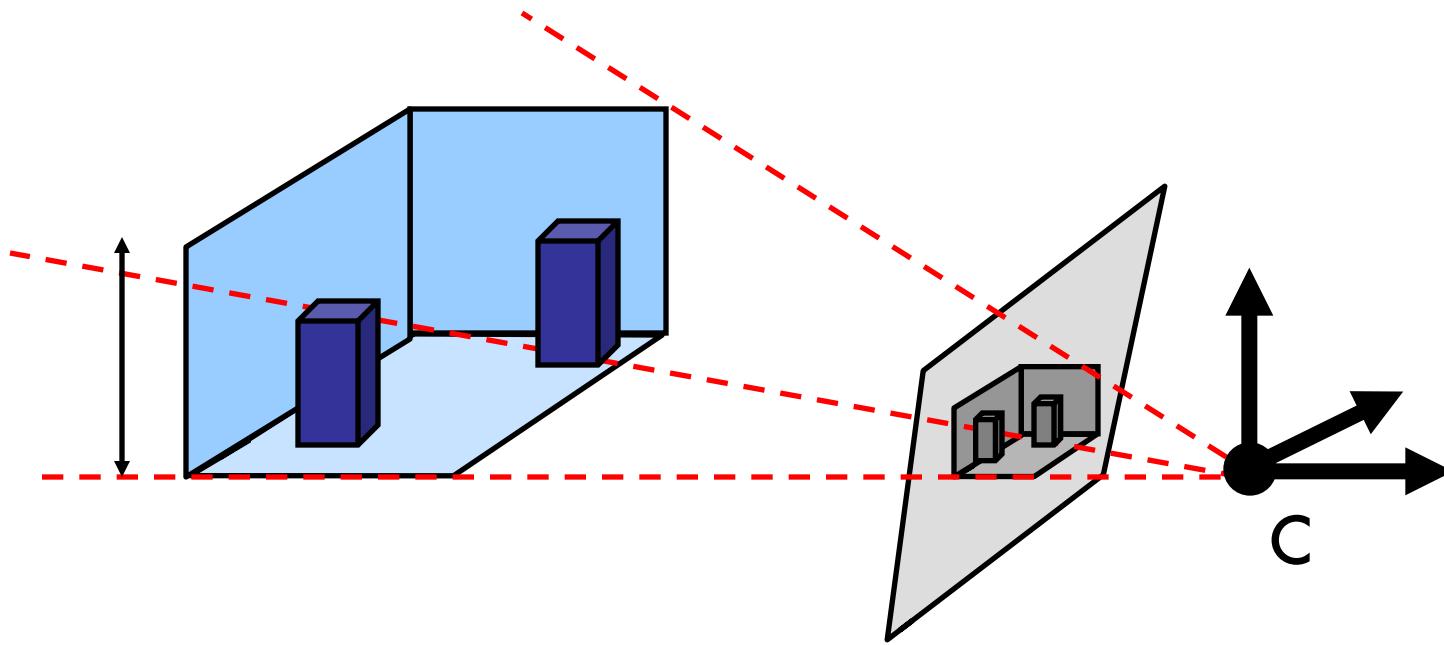

[Eq. 27]

$$K \text{ known} \rightarrow n = K^T I_{\text{horiz}}$$

= Scene plane orientation in
the camera reference system

Select orientation discontinuities

Single view reconstruction - example

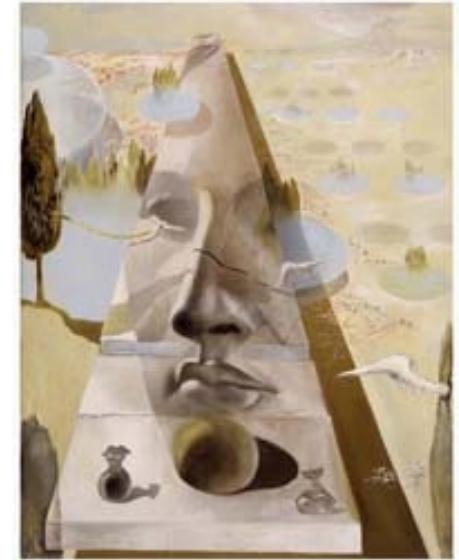

Recover the structure within the camera reference system

Notice: the actual scale of the scene is NOT recovered

- Recognition helps reconstruction!
- Humans have learnt this
